

AutoAI Lab + DevOps

This lab consists of two parts. The first part will demonstrate the new and exciting AutoAI capability to build and deploy an optimized model based on the Titanic data set. The second part will deploy an application using the IBM Cloud DevOps toolchain that will invoke the deployed model to predict whether a passenger would have survived.

AutoAI in Watson Studio automatically analyzes your data and generates candidate model pipelines customized for your predictive modeling problem. AutoAI algorithms analyze your dataset to discover data transformations, estimator algorithms, and parameter settings that work best for your problem setting. Results are displayed on a leaderboard, showing the automatically generated model pipelines ranked according to your problem optimization objective.

Using AutoAI, you can build and deploy a machine learning model with sophisticated training features and no coding. The tool does most of the work for you.

The AutoAI process follows this sequence to build candidate pipelines:

- [Data pre-processing](#)
- [Automated model selection](#)
- [Automated feature engineering](#)
- [Hyperparameter optimization](#)

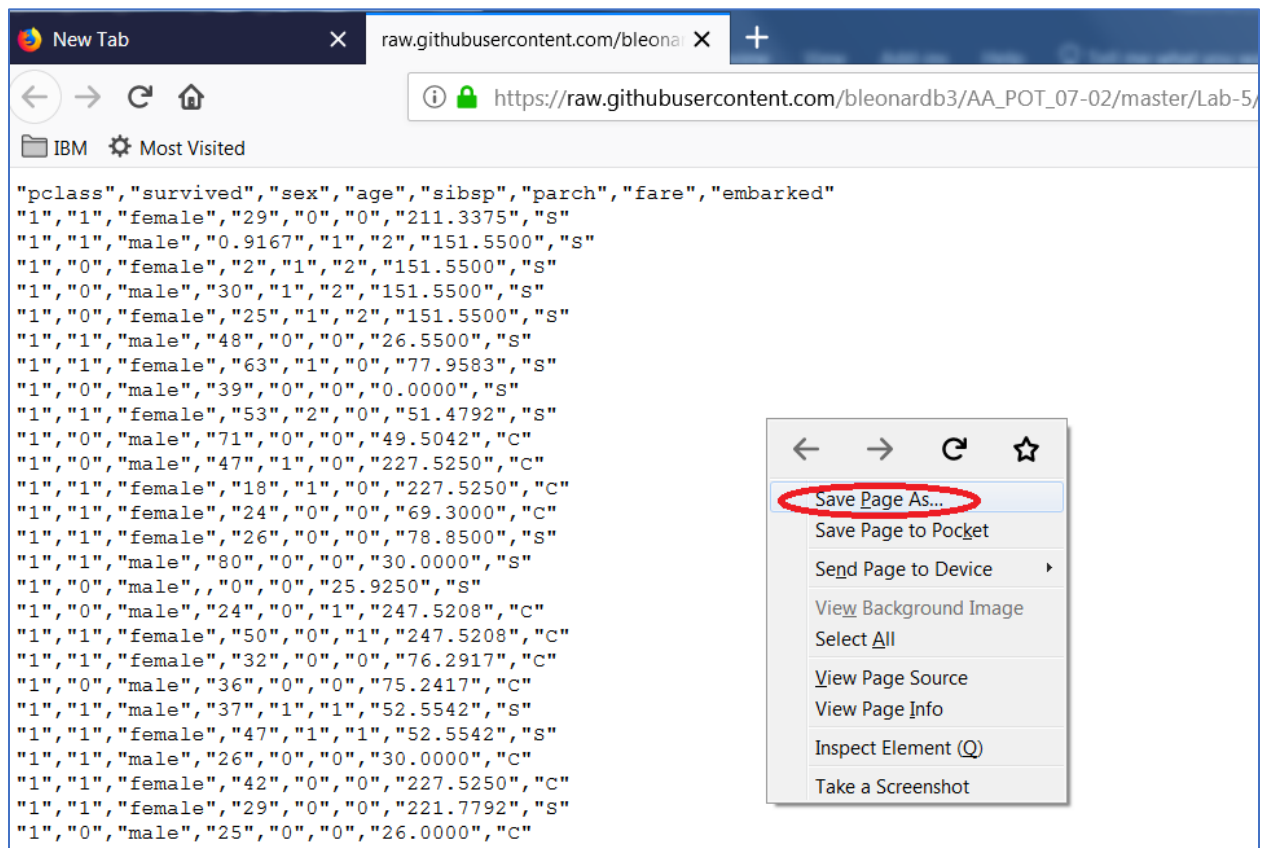

We will perform the following steps in this lab:

1. Download a Titanic cleansed data set
2. Add an Auto AI Experiment
3. Save and Deploy the selected model.

4. Deploy a simple web front-end application and connecting it to the deployed model using an IBM Cloud toolchain.
5. Make a coding change and re-build the application using the DevOps toolchain
6. Run the application, input passenger data, and receive the survivability prediction.

Step 1: Download the titanic_cleansed.csv data set

1. Download the **titanic_cleansed.csv** data file from the following location by clicking on the link [here](#). Note this is a different file than used in the previous labs.
2. Right-click on the window, and click **Save Page As...**

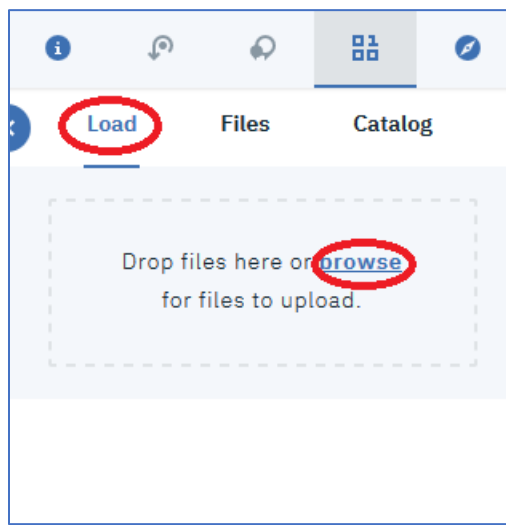

3. Click on **Save**.

4. Go back to your Watson Studio Labs project. Click on the  icon.

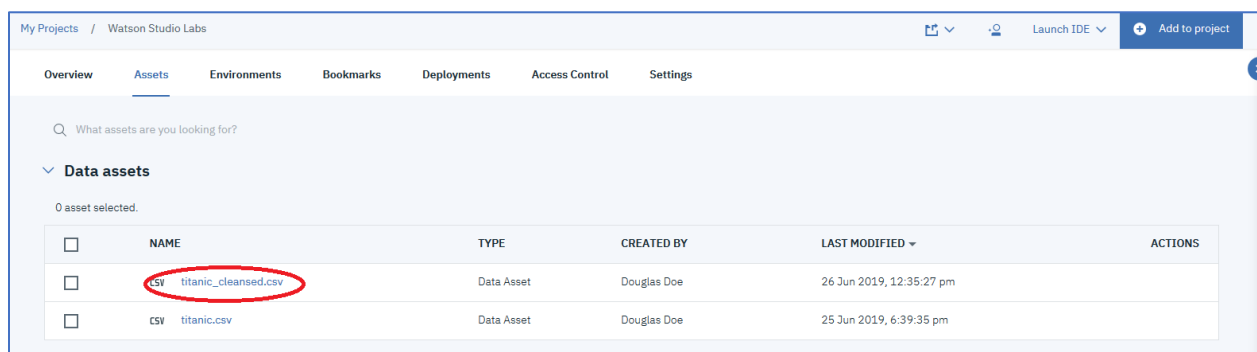

5. Click on the **Load** tab and then click on **browse**. If you don't see the **Load** tab, click on the  icon again.

6. Go to the folder where the titanic_cleansed.csv file is stored. Select the titanic_cleansed.csv file and then click **Open**.

7. The titanic_cleansed.csv file is now added as a Data Asset.

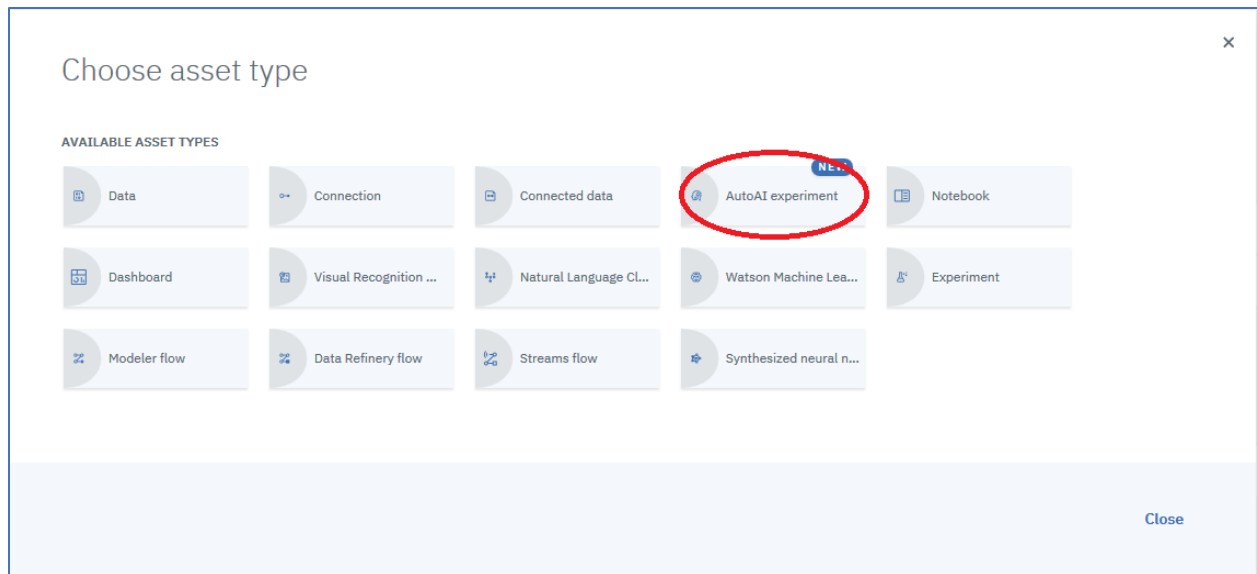

Step 2: Add an AutoAI Experiment

1. Click on **Add to project**.

2. Click on **AutoAI experiment**

3. Enter an **Asset name**, leave the defaults for the **Watson Machine Learning** and **Compute configuration** and click on **Create**.

Create AutoAI experiment

Use this no-code approach to generate a prediction based on data you provide. AutoAI automatically finds the best algorithm for your data and use case. [Learn more](#)

4. Click on **Select from project**.

5. Click on **titanic_cleansed.csv** and then click on **Select asset**.

6. Click on **survived** as the column to predict. Note, based on this selection, the **Prediction Type** is **Binary Classification**, and the **Optimized Metric** is the **Area under the Receiver Operating Characteristic(ROC AUC)** curve. Further note, the **Positive Class** is correctly defaulted as “1” – survived.

Select column to predict

- Please wait several minutes as the alternative solutions are analyzed. The pipeline summary is then displayed. Click on the right arrow ▶️ next to the top ranked pipeline.

Pipeline leaderboard Compare pipelines Ranking based on: ROC AUC (Optimized) ▼

Rank	Name	Estimator	ROC AUC	Enhancements	Build time
▶️ ★ 1	Pipeline 2	XGB classifier	0.868	HPO-1	00:00:27
> 2	Pipeline 4	XGB classifier	0.866	HPO-1 FE HPO-2	00:02:26
> 3	Pipeline 3	XGB classifier	0.866	HPO-1 FE	00:02:17
> 4	Pipeline 1	XGB classifier	0.863	None	00:00:01

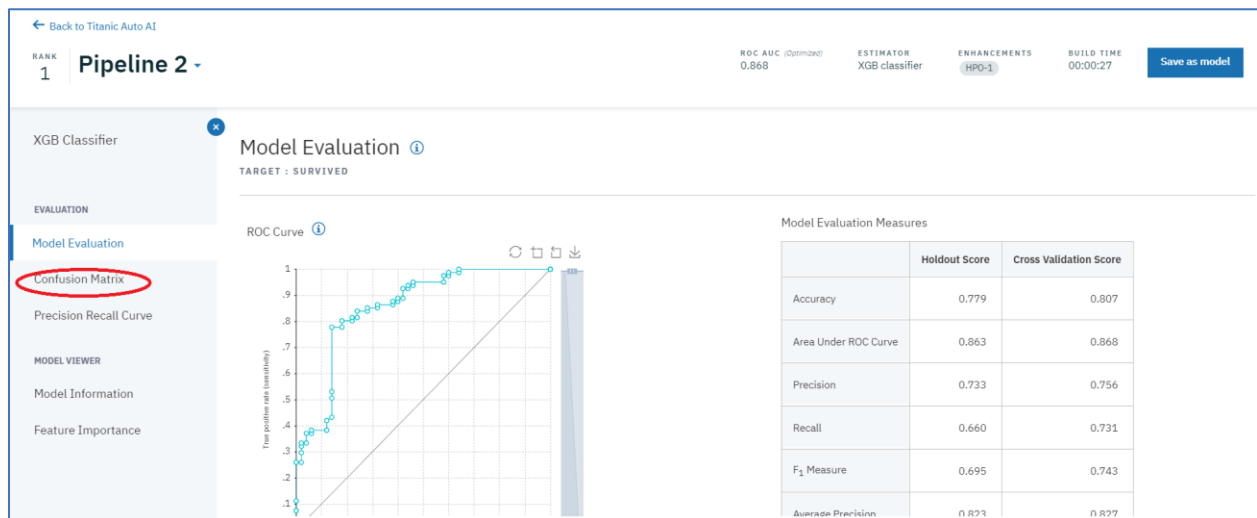

- Scores are displayed for different metrics for both the training sample and the holdout sample.

10. Click on the **Pipeline** link for the top ranked pipeline.

11. The model evaluation metrics for the training sample are repeated. On the left are options for additional information. Click on the **Confusion Matrix**.

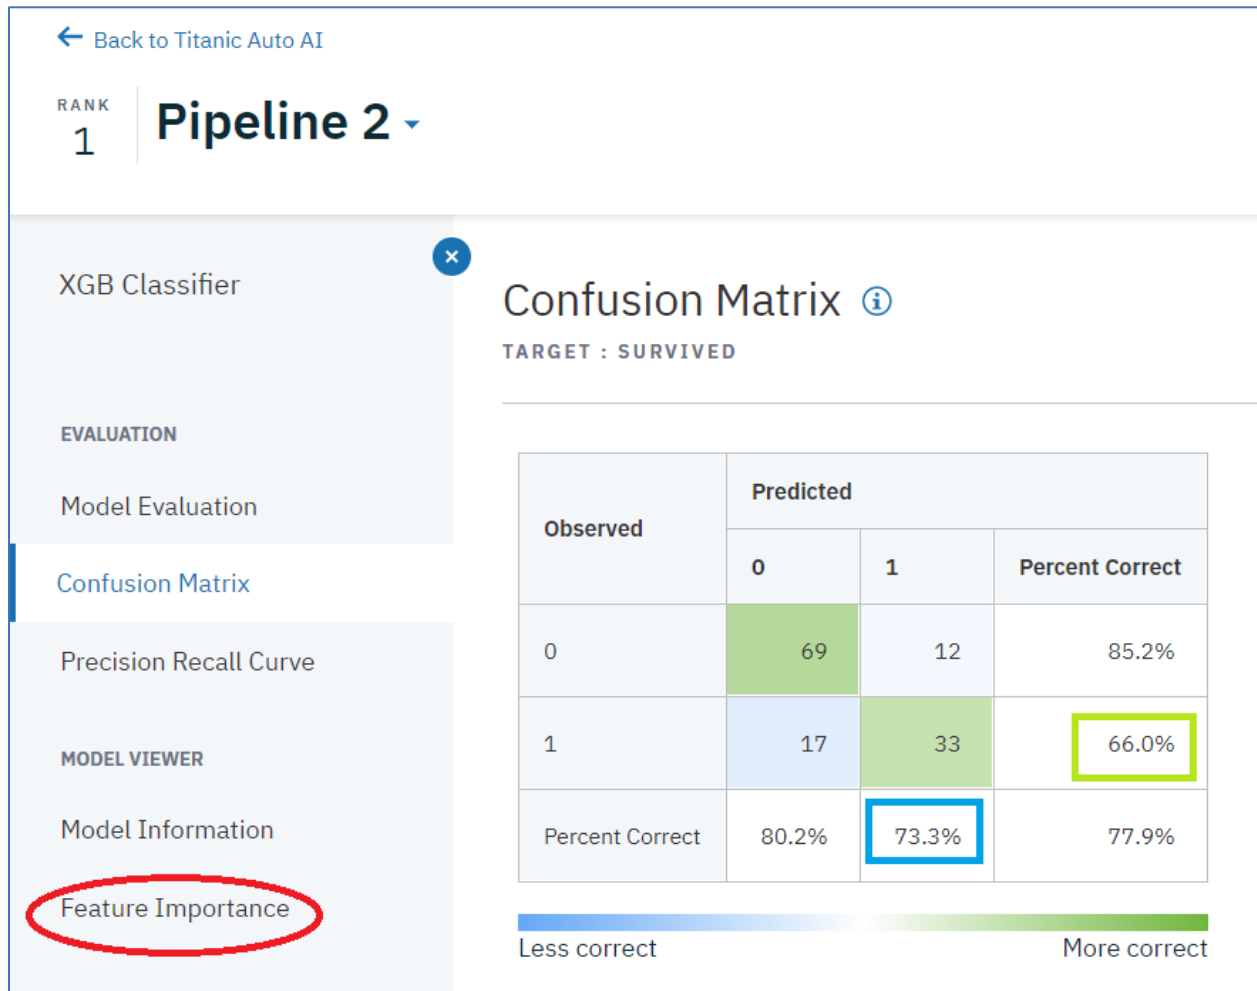

12. The Confusion Matrix is displayed for the holdout sample. The different metrics are computed based on the numbers in the Confusion Matrix. For example, Precision is defined by the percentage of predicted positives that are actually positive (i.e. the percentage of predicted survivors that survived). Recall is defined as the percentage of observed positives that the model predicts are positive (i.e. the percentage of survivors

that the model predicted would survive). Note the higher the Precision the lower the Recall.

Precision = True Positive/ (True Positive + False Positive) – shown inside blue rectangle on diagram below.

Recall = True Positive/(True Positive + False Negative) - shown inside green rectangle on diagram below

After viewing the Confusion Matrix, click on the **Feature Importance** option.

13. According to the Feature Importance, the sex variable is considered the most important feature followed by the passenger class.

Step 3 – Save and Deploy the Selected Model

1. Click on **Save as Model**

2. Optionally change the default name and click on **Save**.

×

    }
  ]
}
```

12. The Implementation panel provides information for the application developers to invoke the deployed model. It includes sample code in various programming languages and the scoring endpoint to be used when invoking the web service. Open Windows Notepad to copy and paste the scoring endpoint, or just leave this panel available to cut and paste the scoring endpoint. We will need the scoring endpoint in the next section.

Step 4: Deploy a simple web front-end to invoke the Watson Machine Learning service

This section will provide an example of a simple Python Flask web front-end application that invokes the Titanic scoring API demonstrating embedding machine learning in a web app. You will click on a link below that will deploy the sample Python web application into your IBM Cloud account. A toolchain will be set up for continuous delivery of the application. The application code will be cloned from a public Git repository into a private Git repo in your account that will be set up as part of the toolchain. Each time you commit changes to the repo, the app will be built and deployed.

The toolchain uses tools that are part of the Continuous Delivery service. If an instance of that service isn't already in your account, when you click **Deploy**, it is automatically added with the free [Lite](#) plan selected.

You will need to configure the application to provide the credentials for your Watson Machine Learning service, and to provide the scoring endpoint.

1. Click on the **Deploy to IBM Cloud** link below to deploy a sample Python Flask web application into your IBM Cloud account. Note you may get this message – “*An IBM Cloud account is required. To get started, click Log In or Sign Up at the top of this page*”. If you get this message, click on **Log In**.

[Deploy to IBM Cloud](#)

2. In the **Select Region**, make sure that the region is Dallas. If not, change it to Dallas, then click **Create**.

15. We now have tied the web application to the Watson Machine Learning service. Note that the Watson Machine Learning service could have more than one deployed model

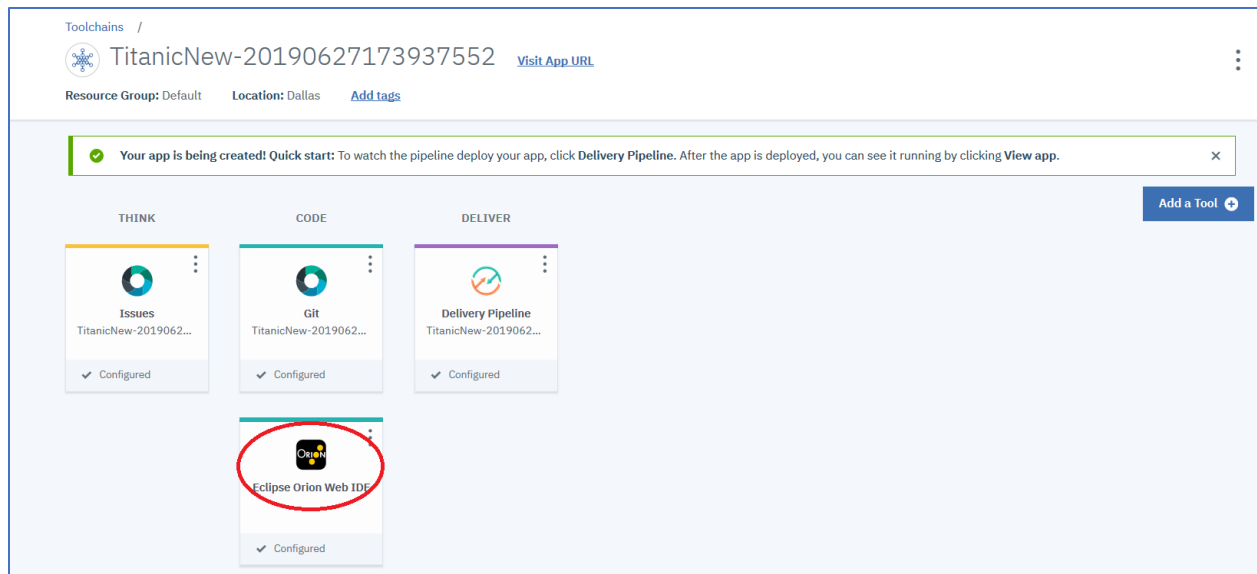

available to select and then embed in the web application. Click on the  icon and click on DevOps in the pulldown to navigate to the Toolchain.

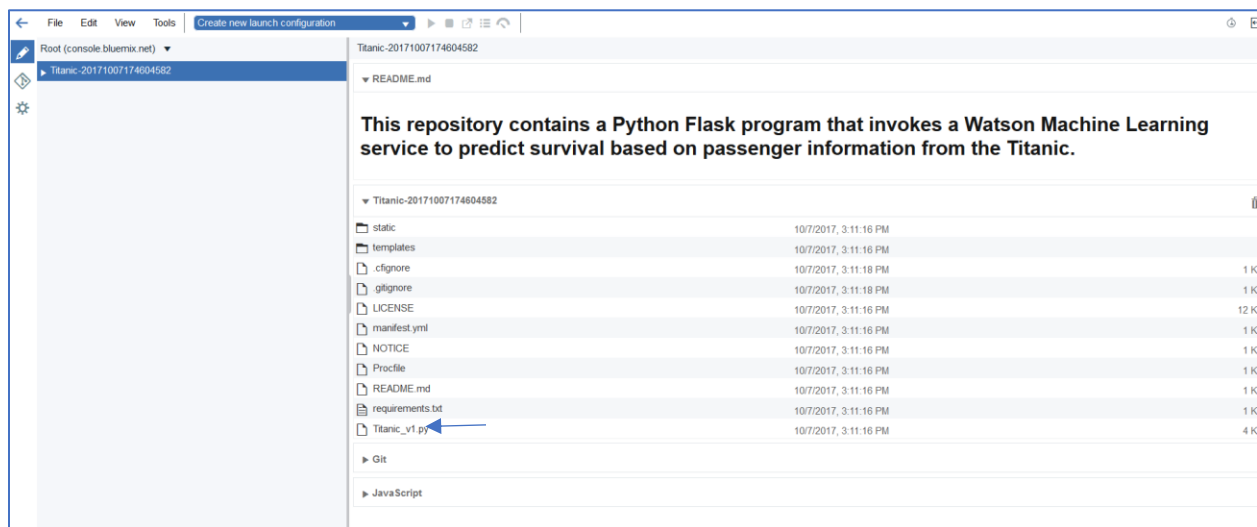

16. We are now going to paste the scoring endpoint into the application code. Click on the Toolchain (Titanic-2019xxxxx below). If no toolchain appears, switch the region to Dallas.

17. Click on the Eclipse Orion Web IDE.

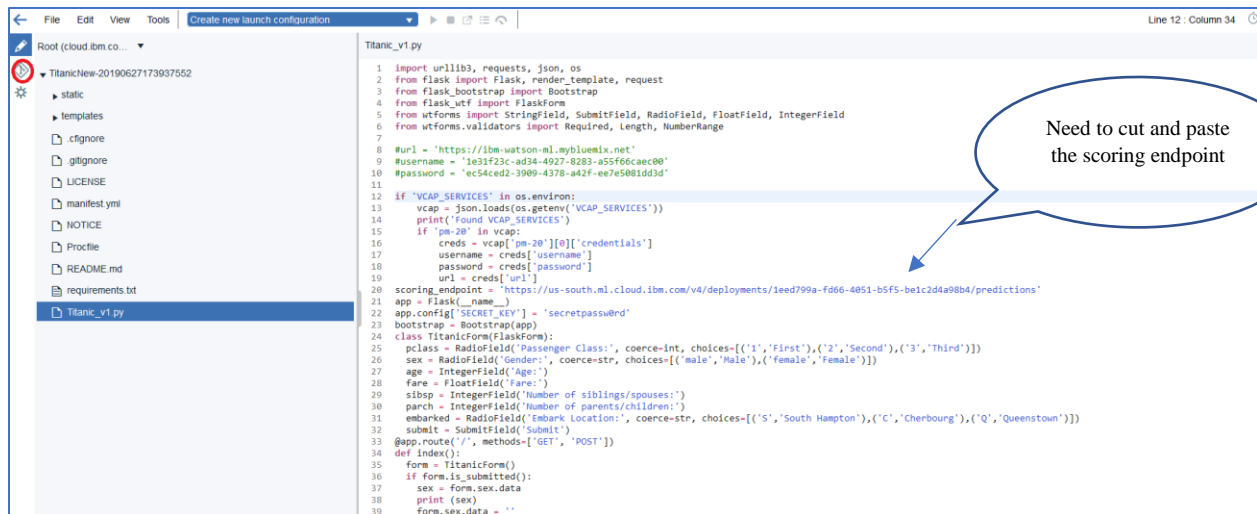

18. Click on the Titanic_v1.py file. This is a python source file.

19. Look around line 20 in the Titanic_v1.py file for the “scoring endpoint =”. Select the scoring endpoint value in line 20 (starting with https:// you may want to use Shift-End to get to the end of the line, and then back up one space to not select the endpoint quote – if you do just make sure to put it back in). Copy the scoring endpoint from the Watson Studio Implementation panel (in Notepad) and use Ctrl-V to paste the scoring endpoint into the Titanic_v1.py file. Enter Ctrl-S or File > Save to save the file. Then click on the

icon on the top left.

20. The next step is to commit the change to the git repository. Enter “Changed the Scoring Endpoint” in the Enter Commit Message field, and then click on **Commit**.

21. Then click on **Push** to push the changes to the central Git repo which will start the build and deploy of the application. Click on the left arrow to return to the Toolchain.

22. Click on the **Delivery Pipeline** to view status of the deployment as before. Once the Deploy Stage status shows **Deploy passed now** (it shouldn't take longer than 2 minutes

so reload the browser in case the UI didn't update), click on **View Console**, and then **Visit App URL** (refer to steps 6,7,8 above) to view the running application.

23. The web form should appear. Enter data in all the fields and click on the **Submit** button.

[Try Again!](#)

Congratulation! You have completed the Lab!!!

✓ Added an AutoAI Experiment

- ✓ Saved and Deployed the selected model
- ✓ Deployed a simple web front-end application and connected it to the deployed model.
- ✓ Made a coding change and re-built the application using the DevOps toolchain
- ✓ Ran the application, inputted passenger data, and received the survivability prediction.
